OmniRush — UI Fix Instructions

Design reference: Descript (not Opus Clip) Use Descript as the style base: clean, calm, beginner-friendly, lots of white space, very little on screen at once. Do NOT copy Opus Clip's dense, numbers-heavy, panel-heavy layout.

Goal: Fix the messy, unorganized UI so a complete beginner can open the app, understand what to do, review clips, edit simply, and export — without confusion.

CHOSEN LAYOUT — Use this one, not alternatives

Vertical clips sidebar + full main stage for the selected clip.

```
+-------------------------------------------------------------+
| Header: Project title                            [Export]  |
+--------------+------------------------------+---------------+
| CLIPS        |                              | EDIT THIS CLIP|
| (vertical    |   SELECTED CLIP              |               |
|  sidebar)    |   Large / full main stage    | Captions      |
|              |   player                     | Trim          |
| [thumb] Clip1|                              | Title         |
| [thumb] Clip2|   [ Play / Pause ]           | Format        |
| [thumb] Clip3|                              | Advanced v    |
| [thumb] Clip4|                              |               |
| ... scroll   |   [ Approve ]                |               |
+--------------+------------------------------+---------------+
```

- **Left side:** A vertical sidebar listing all clips, top to bottom, scrollable. Thumbnails only — no live players in the sidebar.
- **Main area (everything else):** When the user clicks/selects ONE clip in the sidebar, that clip opens large in the main stage — filling the main area (full-screen focus within the app, not a small preview).
- **Edit in the main stage:** The edit options for that selected clip are shown with it in the main stage (panel on the right side of the main stage, or below the player on smaller screens) so the user reviews AND edits the same clip in the same place.
- **Switching clips:** Clicking another clip in the sidebar instantly replaces the clip in the main stage, and the previous clip stops playing (see Fix 1). The sidebar stays visible so the user can keep picking clips without leaving the screen.
- Do NOT use a grid of playing videos, a horizontal filmstrip as the main layout, or separate pages for review vs. edit.

Short prompt to give your builder

Copy-paste this after dropping this file into your project folder:

> Read `UI_FIX.md` in this folder and implement all 6 fixes in it. Use Descript as the UI style reference, and use the CHOSEN LAYOUT in the file: vertical clips sidebar on the side, and when I select one clip it opens large/full in the main stage where I edit it. Do not change the app's core functionality — only fix playback behavior, layout, organization, and clarity as described. When you're done, confirm each of the 6 fixes against the Acceptance Checklist at the end of the file.

The 6 Fixes

1. Only ONE video should play/display at a time — CRITICAL BUG

Problem: When a user opens one video, then opens a second video, both are displaying/playing instead of the first one stopping.

Fix:

- Maintain a single global `activeVideoId` state for the whole app/page.
- When a new video is opened/played:
  - Pause the previous video immediately (`pause()`).
  - Reset its playback position display, hide its player controls overlay if needed, and collapse/minimize its player if it is not the active one.
  - Unload or suspend the previous video element if it is off-screen / in a collapsed clip card, to save resources.
- Only the active video element may have `autoplay`, sound on, and visible playing state.
- Clicking a clip in the list should make *that* clip the only active player — everywhere else should show a thumbnail/poster, not a live player.
- Test: Open Video A and play it → open Video B → Video A must be paused and no longer displaying as playing. Audio from A must stop instantly.

2. Overall layout is messy and not organized

Problem: The UI feels cluttered and disorganized. Too many elements compete for attention at the same level.

Fix — Descript-style layout (the CHOSEN LAYOUT above):

- Use a simple, calm hierarchy:

1. **Top:** One clear header — project/video title + ONE primary action (e.g. Export).
2. **Side:** A vertical sidebar of clips (thumbnails, top to bottom, scrollable).
3. **Main stage:** The single selected clip, large and filling the main area, when a clip is selected.
4. **With the main stage:** Edit options for the *selected clip only* (see Fix 3).

- Generous white space and consistent padding (16–24px). Group related things in one card, separate unrelated things clearly.
- One font hierarchy only: Page title > Section title > Label > Body. No random sizes/colors.
- Limit colors: neutral background, one accent color for the primary action/selected state. No rainbow badges.
- Every screen should answer in 3 seconds: *What am I looking at? What can I do next?*
- Remove, hide, or move to a "More" menu anything that is not needed for the main flow: Upload → Review clips → Edit → Approve → Export.

3. Edit options are messy / hard to find

Problem: The edit options area is disorganized — the user can't tell where the edit options are or what they do.

Fix:

- Show edit options in ONE dedicated, clearly labeled panel: **"Edit this clip"** — only for the currently selected clip.
- Group the options in this order, with plain-English labels:
  1. **Captions** — On/Off, style (simple choices, not 20 options)
  2. **Trim** — Start / End sliders
  3. **Text / Title** — Title text field
  4. **Format** — 9:16 / 16:9 / 1:1
  5. **Other / Advanced** — Collapsed by default, click to expand
- Default view shows only the 4–5 most-used options. Everything advanced stays collapsed.
- When no clip is selected, this panel shows a simple message: *"Select a clip to edit it"* — not a bunch of disabled controls.
- Use toggles, sliders, and dropdowns with labels — no icon-only buttons without text for beginner actions.

4. Too many numbers / scores shown like Opus Clip

Problem: Numbers, scores, and structure taken from Opus Clip make the UI feel technical and overwhelming for beginners.

Fix:

- Per clip, show **ONE simple score max**, e.g. a badge like `92` or "Great match" — not multiple metrics (virality, hook, flow, value, etc.) all at once.
- Move any detailed scores/metrics into a collapsed "Why this clip?" / "Details" section that opens on click.
- In the clip list, each clip card shows only:
  - Thumbnail
  - Title (1 line)
  - Duration
  - One score badge
  - Status: Not reviewed / Approved / Edited
- No dense tables, no multi-column numbers, no charts on the main screen.

5. Clip list needs to be clean and scannable

Problem: Clips are hard to scan and act on when the list is cluttered (this also causes Fix 1 — multiple players in the list).

Fix:

- Vertical sidebar list of clip cards, one per row, consistent height and spacing, fixed sidebar width (approx. 300–340px on desktop), scrollable top to bottom.
- A clip card is NOT a live video player. It shows a thumbnail/poster only, until it is selected and opens large/full in the main stage as the single active player (Fix 1).
- Each card has exactly two clear actions: **Review / Play** and **Approve** (plus a small "..." menu for Delete / Duplicate).
- Selected card is clearly highlighted with the accent color border/background.
- Sort/filter at the top of the list only: `All | Approved | Not approved` and Sort: `Top score | Newest`. Nothing else in the main view.
- Show clip count simply at the top: e.g. *"12 clips found"*.

6. Beginner-friendly flow and language

Problem: A beginner should not need instructions to use the main flow.

Fix:

- Use plain language everywhere: "Create clips", "Approve", "Export" — not technical jargon.
- One primary button per screen/section. Secondary actions are quieter (outline/ghost).
- Clear empty states: If there are no clips yet, show *"Upload a video to create clips"* with an Upload button — not a blank messy area.
- Clear success/finish state: After approving clips, show *"X clips approved — Ready to export"* with an Export button.

- No pop-ups/modals for routine actions if an inline panel will do. Confirm only for Delete.
- Keep the whole main flow on ONE screen: vertical clips sidebar + full main stage (player + edit panel), no jumping between pages to review or edit one clip.

Design Rules (apply everywhere)

- **Reference:** Descript — calm, white, simple.
- **Spacing:** Consistent 16–24px padding, 12–16px between cards.
- **Typography:** 1 sans-serif font, max 3 sizes on a screen.
- **Color:** Neutral (white / light gray / dark text) + 1 accent color.
- **Components:** Same button, card, toggle, and badge style everywhere.
- **Rule:** If an element doesn't help Upload → Review → Edit → Approve → Export, remove it, hide it, or collapse it.

What NOT to do

- Do not add new features.
- Do not add more panels, metrics, or options to "fix" clutter.
- Do not make multiple videos play at once for preview/comparison unless the user explicitly clicks a Compare action.
- Do not copy Opus Clip's layout/density. Copy Descript's simplicity.

Acceptance Checklist

The builder must confirm ALL of these before saying it's done:

- [ ] Opening/playing a second video instantly pauses and deactivates the first video (video + audio)
- [ ] Only one live player exists on screen at a time; clip list shows thumbnails only
- [ ] Layout matches the CHOSEN LAYOUT: vertical clips sidebar on the side, selected clip opens large/full in the main stage, and edit options are right there with it in the main stage
- [ ] Main screen has a clear hierarchy: header → clips sidebar → full main stage player → edit panel
- [ ] Edit options are in one labeled panel ("Edit this clip"), grouped, with advanced options collapsed
- [ ] Each clip shows only one score badge in the main list; detailed metrics are collapsed
- [ ] Clip cards are uniform, scannable, with only Review/Play and Approve as main actions

- [ ] Primary flow is understandable without instructions: Upload → Review → Edit → Approve → Export
- [ ] UI looks like Descript: calm, lots of white space, one accent color, no dense panels

---

Note on scope

This file is based on the problems discussed on the call: (1) multiple videos playing at once, and (2) a messy/unorganized UI, especially the edit options and the numbers/structure. The 6 fixes above organize those points into an implementable spec. Edit any fix in this file before handing it to your builder if a point doesn't match what you meant.
